NPS Analysis – Cohort and Segment Trends

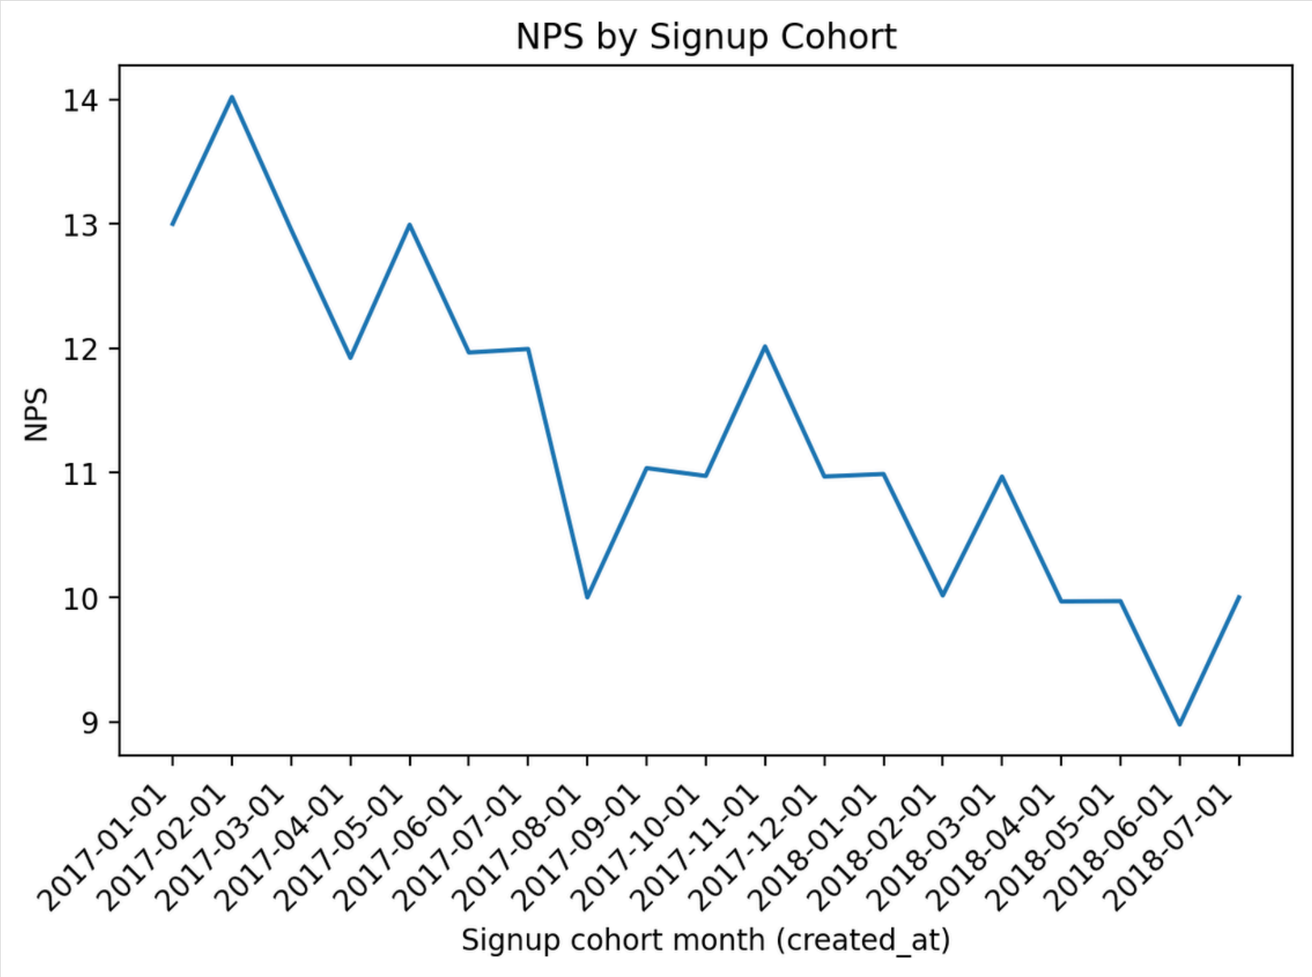
Objective:

- Analyze NPS one month after user signup
- Understand trends by cohort and user segment

Methodology:

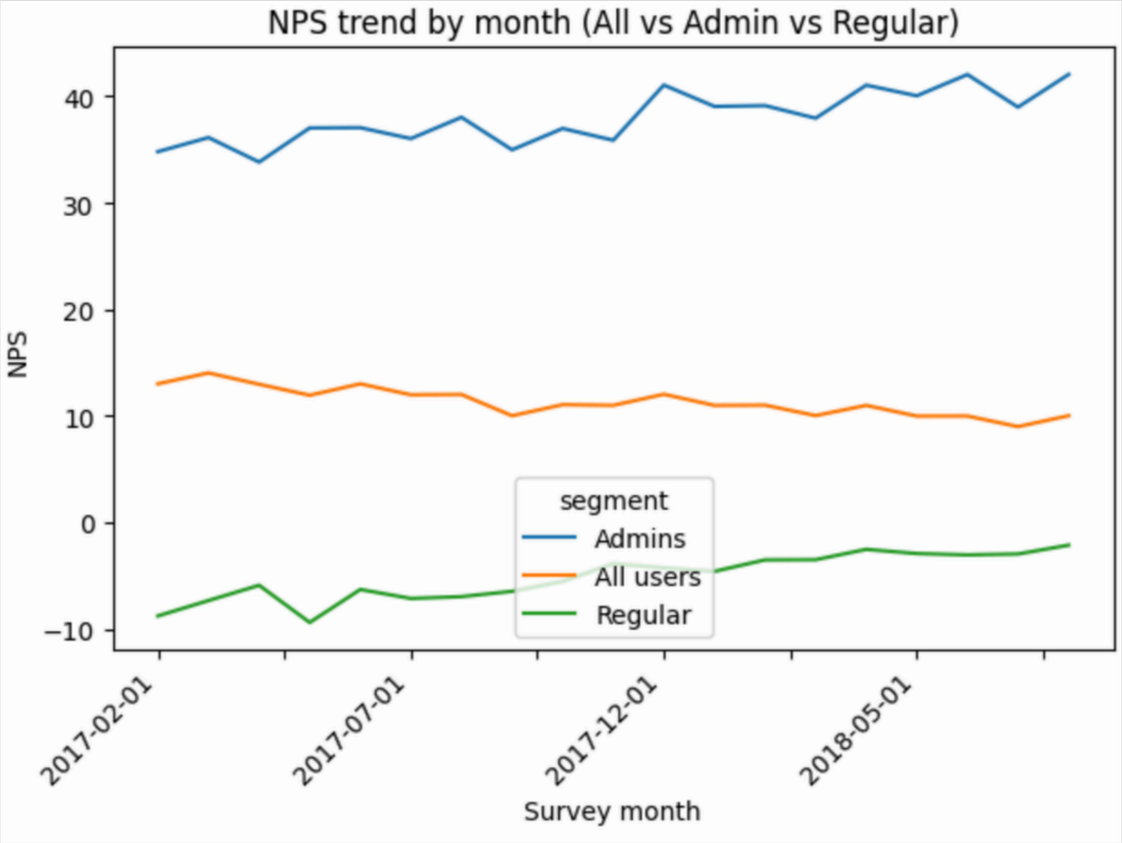
- NPS = (% Promoters – % Detractors)
- Promoters: score 9–10
- Detractors: score 0–6
- Cohort = month of created_at
- Trend = month of surveyed_at

NPS by Signup Cohort



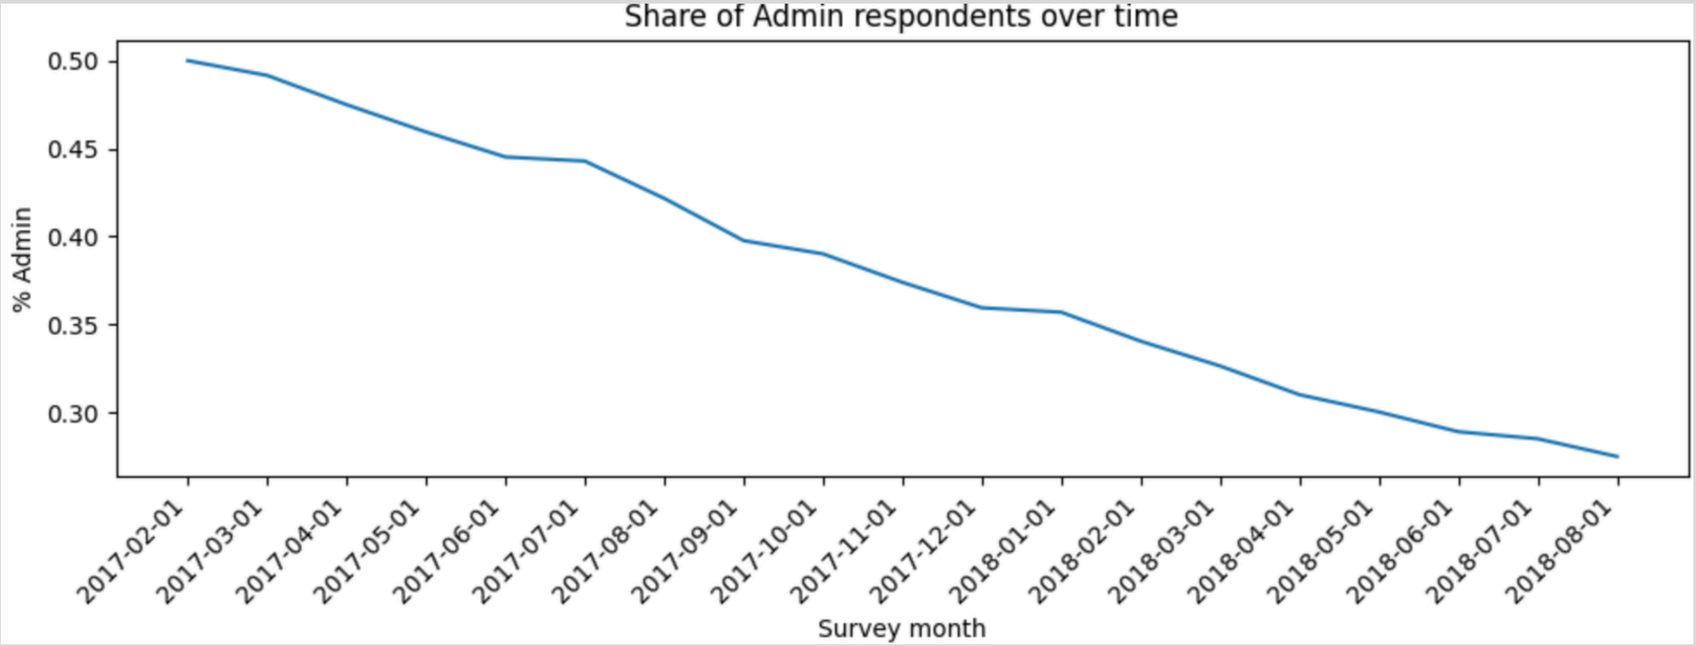
- Cohort NPS ranges between ~9 and ~14.
- Early 2017 cohorts show higher NPS (~12–14).
- 2018 cohorts stabilize around ~9–11.
- No sharp structural break, but a mild downward trend over time.
- Cohort-level NPS remains relatively stable but shows gradual decline from 2017 to mid-2018.
- Later cohorts do not outperform earlier cohorts.

Monthly NPS by User Segment



- Admin users report consistently high NPS, reaching 42.0 in Aug 2018.
- Regular users report negative NPS (-2.2 in Aug 2018), though improving over time.
- Overall NPS remains moderate at 10.0, significantly below Admin levels.
- The satisfaction gap between Admin and Regular users drives overall NPS.

How Changes in User Composition Affect Overall NPS



- Admin users have substantially higher NPS than Regular users.
- The share of Admin respondents declines from ~50% (early 2017) to ~28% (mid-2018).
- Overall NPS is a weighted average of segment NPS.
- As the proportion of high-NPS Admin users decreases, overall NPS declines.
- This reflects a classic mix shift (Simpson’s Paradox).

Key Findings & Next Steps

Regular users are the primary driver of overall NPS.

A significant satisfaction gap exists between Admin and Regular users.

Changes in user composition materially affect aggregate NPS. Improving the Regular user experience should be a strategic priority.

NPS should be monitored at the segment level.
